

1. 3.11, 3)

$$TU(a, b) = T(U(a, b)) = T(a + b, a) = (-2a - 3b, b)$$

whereas

$$UT(a, b) = U(T(a, b)) = U(-3a + b, a - b) = (-2a, -3a + b).$$

So  $UT \neq TU$ .

2. 3.11, 9) We will prove  $(a) \iff (b)$  and then  $(a) + (b) \iff (c)$  and  $(a) + (b) \iff (d)$ . The main point is proving  $(a) \iff (b)$  since the other two are almost by definition.

Suppose  $T$  is one-to-one and  $V$  has dimension  $n$ . Since  $T$  is one-to-one,  $N(T) = \{0\}$  and thus  $\dim N(T) = 0$ . Thus, by the rank-nullity theorem,  $\dim(T(V)) = n$  and since  $V$  is  $n$ -dimensional we have that  $T(V) = V$ , hence  $T$  is onto.

Suppose now that  $T$  is onto. Then  $T(V) = V$  and hence  $\dim(T(V)) = n$ . Now by the rank-nullity theorem,  $\dim N(T) = 0$  and hence  $T$  is one-to-one.

We have seen that being one-to-one and onto is equivalent to being an isomorphism, hence  $(a) + (b) \iff (c)$ .

We have also proven that being one-to-one and onto is equivalent to being invertible, hence  $(a) + (b) \iff (d)$ .

3. 3.13, 4) We want to show that  $\dim(T(V)) = \text{rank}(A)$ . Fix a basis  $\mathcal{B} = (b_1, \dots, b_n)$ . Then we know  $T(V) = S(T(b_1), \dots, T(b_n))$ , hence

$$\dim T(V) = \dim S(T(b_1), \dots, T(b_n)).$$

On the other hand, by definition, since  $\text{rank}(A)$  is the dimension of the column space and the columns of  $A$  are  $[T(b_1)]_{\mathcal{B}}, \dots, [T(b_n)]_{\mathcal{B}}$ , we have

$$\text{rank}(A) = \dim S([T(b_1)]_{\mathcal{B}}, \dots, [T(b_n)]_{\mathcal{B}}).$$

But, the map “sub- $\mathcal{B}$ ” (choosing coordinates) is an isomorphism, hence these dimensions are the same.
