Lecture 2

Counting Techniques §2.3

The Three Basic Rules

1. The Product Rule for Ordered Pairs and Ordered k-tuples

Our first counting rule applies to any situation in which a set consists of ordered pairs of objects (a, b) where a comes from a set A and b comes from a set B.

(in terms of pure mathematics the Cartesian product $A \times B$ is the set of such pairs

$$A \times B = \{(a, b) : a \in A, b \in B\}$$

<u>Proposition</u> (text pg 60)

If the first element of the ordered pair can be selected in n_1 ways and <u>if</u> <u>for each of these n_1 ways</u> the second element can be selected in n_2 ways then the number of pairs is $n_1 n_2$.

Mathematically – if $\#(A) = n_1$ and $\#(B) = n_2$ then $\#(A \times B) = n_1 n_2$

There are analogous results for ordered triples etc

$$\#(A \times B \times C) = n_1 n_2 n_3$$

Example

How many "words" of two letters can we make from the alphabet of five letters $\{a, b, c, d, e\}$

Solution Note that order counts $ab \neq ba$.

There are two ways to think about the problem picturally.

1. Filling in two slots $\_\ \_$

   We have a choice of 5 ways to fill in the first slot and for each of these we have 5 more ways to fill in the second slot

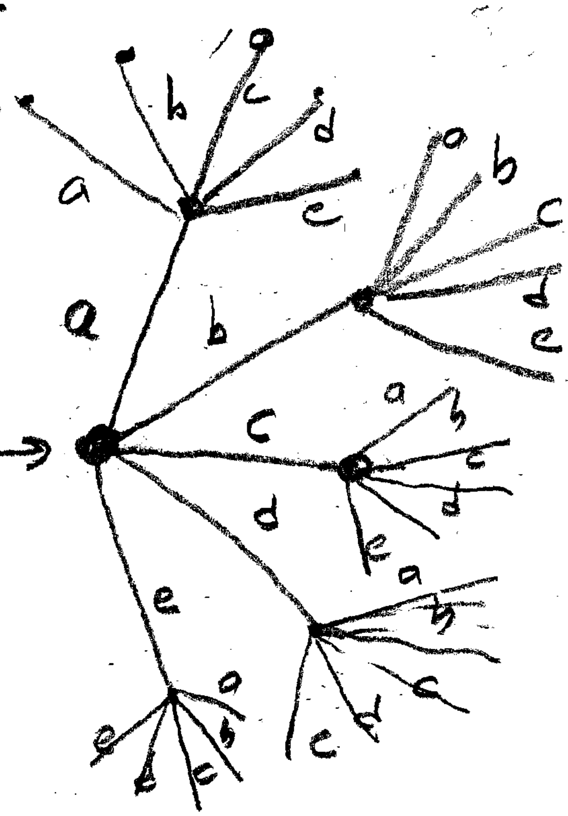
   so we have 25 ways

$$\underline{5}\ \underline{5} = 25$$

2. Draw a tree where each edge is a choice

a leaf

root



The number of pairs is the number paths from the root to a "leaf" (ie a node at the far right).

In this case there are 25 paths

Problem How many words of length 3?

2. Permutations (pg 62)

In the previous problem ~~the~~ the word aa was allowed. What if we required the letters in the word to be distinct. Then we would get 2-permutations from the 5-element set {a, b, c, d}
according to the following definition.

Definition

An ordered sequence of k distinct objects taken from a set of n elements is called a k-permutation of the n objects.

The number of k-permutations of the n objects will be denoted $P_{k,n}$

So <u>order counts</u>

Let us return to our 5 element set $\{a, b, c, d, e\}$ and count the number of 2-permutations.

It is best to think in terms of slots

$$\underline{5}\ \underline{4} = 20$$

There are 5 choices for the first slot but only 4 for the second because whatever we put in the first slot cannot be put in the second slot so $P_{2,5} = 20$

What is $P_{3,5}$?

Proposition (pg 68)

$$P_{k,n} = \underbrace{n(n-1)(n-2)\cdots(n-k+1)}_{k \text{ terms}}$$

Proof Fill in k slots with no repetitions

how many

how many

$$\underbrace{\underline{n}\ \ \underline{n-1}\ \ \underline{\ \ }\ \ \underline{\ \ }\ \ \underline{\ \ }}_{k}$$

$\square$

Note that if we allowed repetitions we would get n^k

$$\underbrace{\underline{n}\ \ \underline{n}\ \ \underline{n}\ \ \underline{\ \ }\ \ \underline{n}}_{k}$$

There is a very important special case

$$P_{n,n} = n! = n(n-1)(n-2)\cdots 3\cdot 2\cdot 1$$

There are $n!$ ways to take n distinct objects and arrange them in order.

<u>Example</u> $n=3$, $\{a, b, c\}$

$$\left.\begin{array}{l} abc \\ acb \\ bac \\ bca \\ cab \\ cba \end{array}\right\} \quad 3! = (3)(2)(1) = 6$$

When you list objects it is helpful to list them in dictionary order.

A Better Formula for $P_{k,n}$

Here is a better formula for $P_{k,n}$

Propositon

$$P_{k,n} = \frac{n!}{(n-k)!}$$

Proof This is an algebraic trick

$$\frac{n!}{(n-k)!} = \frac{n(n-1)\cdots(n-k+1)\overbrace{(n-k)(n-k-1)\cdots 3\cdot 2\cdot 1}^{(n-k)!}}{(n-k)!}$$

So cancel the second part of the numerator with the denominator

$$\frac{n!}{(n-k)!} = n(n-1)\cdots(n-k+1) = P_{k,n}$$

The Birthday Problem

Suppose there are n people in a room. What is the probability B_n that at least two people have the same birthday (eg March 11)?

Let S be the set of all possible birthdays for the n people so

$$\#(S) = (365)^n$$

$$\underbrace{\_\ \_\ \_\ \_\ \_\ \_\ \_}_{n \text{ people}}$$

(we ignore leap-years so this isn't quite regul)

Now let $A \subset S$ be the event that at least two people have the same birthday. So

$A' =$ all the people in the room have different birthdays.

So $$B_n = 1 - P(A')$$

Now what is A'? Order the people

$$\underset{1}{\underline{365}} \quad \underset{2}{\underline{364}} \quad \underset{3}{\underline{}} \quad \_ \quad \_ \quad \underset{n}{\underline{365-n+1}}$$

$$\#(A') = P_{n,365}$$

So $$B_n = 1 - \frac{P_{n,365}}{(365)^n}$$

3. Combinations

There are many counting problems in which one is given a set of n objects and one wants to count the number of unordered subsets with k elements

An unordered subset with k elements taken from a set of n elements is called a k-combination of that set. The number of k-combinations is denoted

$C_{k,n}$.

Which is bigger $C_{k,n}$ or $P_{k,n}$?

What is $C_{n,n}$?

Example

$P_{2,3} = 6$, $C_{2,3} = 3$

$S = \{a, b, c\}$

2 permations of S	2 combinatons of S
ab ba	$\{a, b\}$
bc cb	$\{b, c\}$
ac ca	$\{a, c\}$

Each two combination gives rise to 2 2-permutations.

so

$$P_{2,3} = 2\,C_{2,3} = (2)(3) = 6$$

A Formula for $C_{k,n}$

Proposition (pg 64)

$$P_{k,n} = C_{k,n} \cdot k! \text{ so}$$

$$C_{k,n} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

Proof To make a k-permutation first make an unordered choose of the k-elements ie choose a k-combination, then, for each such choice arrange the elements in order (there are $P_{k,k} = k!$ ways to do this). So we have

$$\#(\text{k-permutations}) = \#(\text{k combinations}) \cdot k!$$

$\square$

More notation

The binomial coefficient $\binom{n}{k}$ is defined by

$$\binom{n}{k} = \frac{n!}{k!\,(n-k)!}$$

This is because

$$\underbrace{(a+b)^n = \sum_{k=0}^{n} \binom{n}{k} a^k b^{n-k}}_{\text{The binomial theorem.}}$$

So

$$C_{k,n} = \binom{n}{k}$$

We will use $\binom{n}{k}$ instead of $C_{k,n}$

The toast problem

When my wife and I were on a trip to Spain with our church we had 20 people at dinner. We all clinked (is this a genuine English word) our glasses. I dazzled my friends by telling how many clinks there were.

Now you can answer the question — how many ?

More problems

1. How many 5 card poker hands are there?

2. How many 13 card bridge hands are there?

Lastly

Proposition

$$\binom{n}{k} = \binom{n}{n-k}$$

Proof Challenge

Find two proofs, one "combinatorial" and one algebraic.
